01. SILMAR GROUP

The Silmar Group is an integrated group of leading companies in the heating, aluminium recycling, and plumbing sectors. The Group was founded in 1963 and is now recognised worldwide with a presence of more than 30 plants, while maintaining its headquarters in Italy, in the province of Brescia.

The successful companies belonging to Silmar Group are leaders in several sectors:

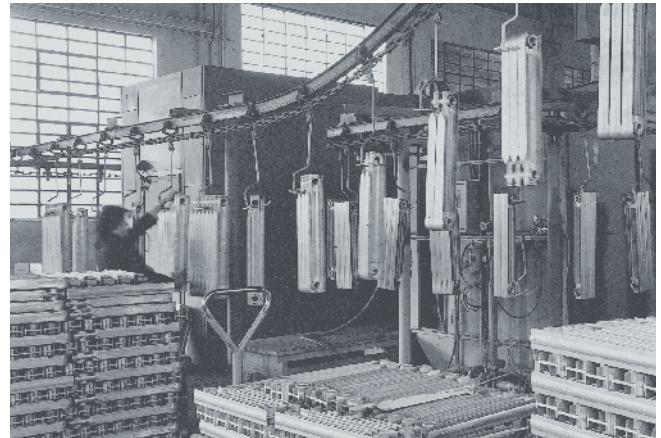

FONDITAL, manufacturer of aluminium radiators, alternative heating systems and energies and structural castings for the automotive sector;

RAFFMETAL, refinery of aluminium alloys from recycling;

VALSIR, manufacturer of water management and drainage systems;

The first factory in Vestone in 1970

The first packaging and coating plant in Vestone in 1970

THE SILMAR GROUP STORY

02. RAFFMETAL

Today, Raffmetal is Europe's largest manufacturer of recycled aluminium alloys.

With an annual productive capacity of over 350,000 tons/year, 404 employees, 2 production plants in Casto and Odolo, in the Brescia area, the company is able to respond to the needs of international customers operating in different industrial sectors.

The total control of the supply chain, the application of technological solutions among the most advanced in the industry in the treatment and selection of scrap and the strict control of the production process, allow us to offer high quality alloys with a low carbon footprint.

THE PRODUCT RANGE

Raffmetal is the reference point and benchmark of the circular economy. The policy of continuous improvement allows the recycling capacity of each type of aluminium scrap to be increased, enhancing its chemical and physical components, ensuring high quality alloys.

Raffmetal offers its customers **a range of recycled and low carbon footprint products:**

- **Continuously cast 100% recycled aluminium alloys.** Produced at the Malpaga plant, these alloys can also be supplied in liquid form, thus guaranteeing the customer considerable energy savings.
- **Primary aluminium alloys from recycling with continuous casting featuring the same performance as primary aluminium alloys from mining, with a low carbon footprint and high circularity rate.** Manufactured at the Special Alloys facility, this innovative range enables a significant reduction in the energy consumption and carbon footprint of customer's castings.

Malpaga plant dedicated to the production of 100% recycled aluminium alloys

Special Alloys production facility for the production of recycled primary aluminium alloys

THE ADVANTAGES OF RAFFMETAL 100% RECYCLED ALUMINIUM ALLOYS

CONTINUOUS CASTING ALUMINIUM INGOTS

- High **metal yield** of the product;
- A **finer and more homogeneous** structure;
- **Storage optimisation**;
- **Traceability** system.

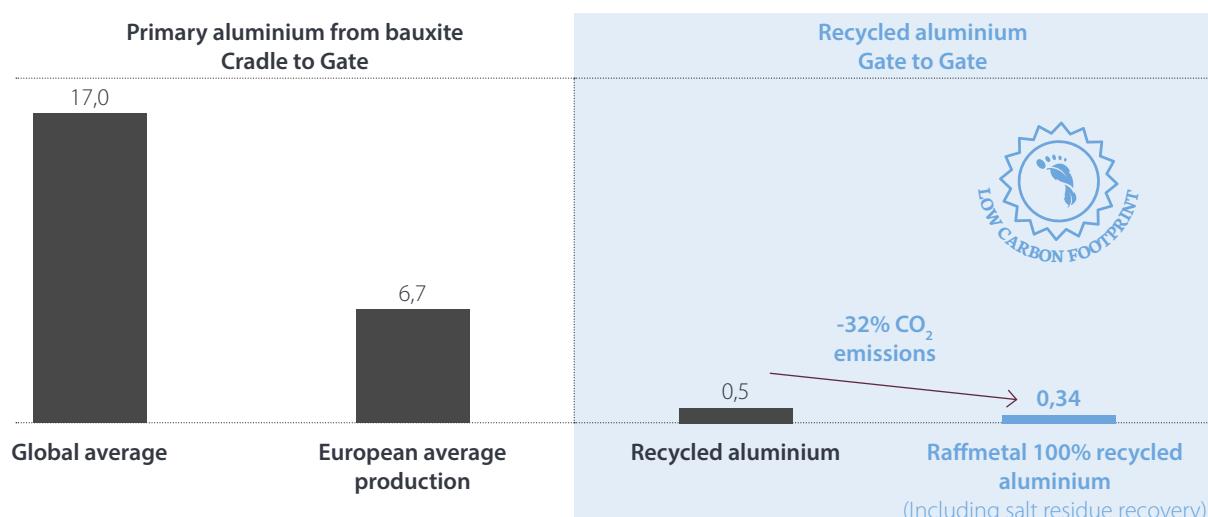

LIQUID ALUMINIUM

- Reduction of **156 kg of CO₂/ton of aluminium**;
- **Saving of 80 m³ of natural gas/ton of aluminium**;
- **2% increase in metal yield** per ton of aluminium;
- **Zeroing of loading-unloading and storage costs**.

CARBON FOOTPRINT OF THE DIFFERENT TYPES OF ALUMINIUM PRODUCTION*

(kg of CO₂e/ kg of Al produced)

THE ADVANTAGES OF RAFFMETAL ALLOYS OVER TRADITIONAL INGOTS

BETTER QUALITY, LESS DEFECTS

- 1** Speed of solidification = less defects. Solidification without contact with air.
A fine and homogeneous structure.
-

HIGHER METAL YIELD, LESS OXIDES

- 2** Solidification without contact with air = less oxides.
Speed of solidification = less intermetallic compounds.
-

SPACE OPTIMISATION

- 3** Package compactness = 40% saving in the area dedicated to package storage.
Customisation of bar length and weight = faster unloading, storage and picking up of packages from the warehouse = shorter furnace package loading time.
-

INCREASED SAFETY

- 4** **Furnace bar loading.** Reduction of possible explosions from damp ingots loaded into the furnace.
Reduced furnace maintenance time. Less ingot pre-heating time.
Package stability. Reduced package handling and storage times. Reduced package breakage during handling.
-

TRACEABILITY

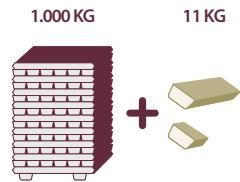

- 5** Raffmetal's aluminium ingots have a traceability system: the casting number is engraved on each individual bar, giving the customer the guarantee that the entire aluminium production cycle can be traced at any time.

RAW MATERIALS

Recycling represents the heart of Raffmetal's production. The raw materials used in the production process result from the collection of processing scraps and components that have fulfilled their original function.

The scrap used is sourced throughout Europe and classified and processed by highly sophisticated and cutting-edge technological systems.

The knowledge acquired in over forty years of experience in the treatment of scrap, as well as the most modern sorting and separation technologies, have made it possible to start production in 2020 of the new range of primary aluminium alloys from recycling with a low carbon footprint.

The initiation of this production allowed the range of purchased scrap to be completed. Traditional scrap was joined by:

- Extruded
- Low-iron primary aluminium casings
- Wheel rims (troma)
- 1.000 Series alloy Sheets/Wires/Cables

R&D AND CUSTOMER CARE

The Raffmetal Research and Development team, thanks to the competence, preparation and latest generation instrumentation present in the internal laboratories covering an area of over 860 m², works daily in order to:

- Increase the exploitation of each type of scrap, from a point of view of both chemical and physical composition. The team of metallurgical engineers and chemists monitors the whole procedure: **from the design to the proper functioning of the alloy in the customer's plant** in order to ensure its productivity in the long run;
- Develop new alloys with better properties, sustainable and competitive also offering a service dedicated to the **customisation of the alloy**.

Customer service in both the development and the use of new alloys

Dialogue and collaboration with customers allow us to meet their needs in a constantly evolving market, developing high-performance, competitive and low carbon footprint products.

Chemical laboratory

WHY CHOOSE RAFFMETAL'S RECYCLED ALUMINIUM?

The strengths of Raffmetal's internal production process allow for a sustainable product with a low carbon footprint.

RAW MATERIALS

Raffmetal's raw material is end-of-life scrap and processing waste. This brings benefits along the supply chain, as it allows:

- Upstream: to **avoid the exploitation of natural resources by mining**.
- Downstream: to **reduce to zero the cost of disposing of scrap metal** that would otherwise be sent to landfill and therefore considered waste.

**Thanks to the circular production of Raffmetal more than
2.200.000 tonnes of CO₂ are avoided each year ***

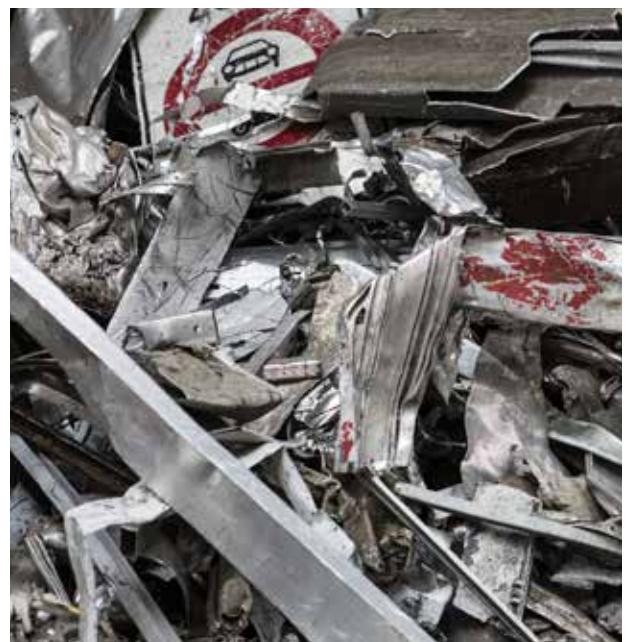

=

Consumption/year of a city of about 380.000 inhabitants

*Compared to the European average of primary aluminium production

Scrap: Turnings

Scrap: Sheets/Plates

CONTINUOUS INNOVATION IN THE PRODUCTION PROCESS

Raffmetal's refining process generates zero waste.

All residues from the refining process are recycled and exploited thanks to the revolutionary **salt residue recovery system**, installed back in 1989, which has made it possible to outline the winning path to recycling and still represents **excellence in the circular economy**.

Salt recovered and reused in the refining process

The supply of aluminium alloys in the liquid form allows considerable energy savings to our customers avoiding the re-melting of ingots as well as an important reduction in terms of CO₂ emissions into the atmosphere, thereby lowering the carbon footprint of the finished product.

ENERGY EFFICIENCY

Raffmetal has always applied a company strategy aimed at the **recovery of all thermal waste available in the company**, constantly innovating systems and reducing the need for energy from fossil fuels.

The heat recovery plant, installed in 2014 with an investment of over 35 million €, provides for the recovery of the heat contained in the exhaust gases coming from the afterburners of the rotary kilns, from the plant for the recovery of the melting by-products and from the drying plant. The self-produced heat **saves natural gas equivalent to the emissions of 12.500 tons of CO₂ per year**.

ENVIRONMENTAL SUSTAINABILITY

The environmental policy reinforces the approach to sustainable development that Raffmetal has always pursued. Management procedures, system investments and actions to mitigate emissions, monitor water consumption and protect biodiversity and woodland flora are proof of this.

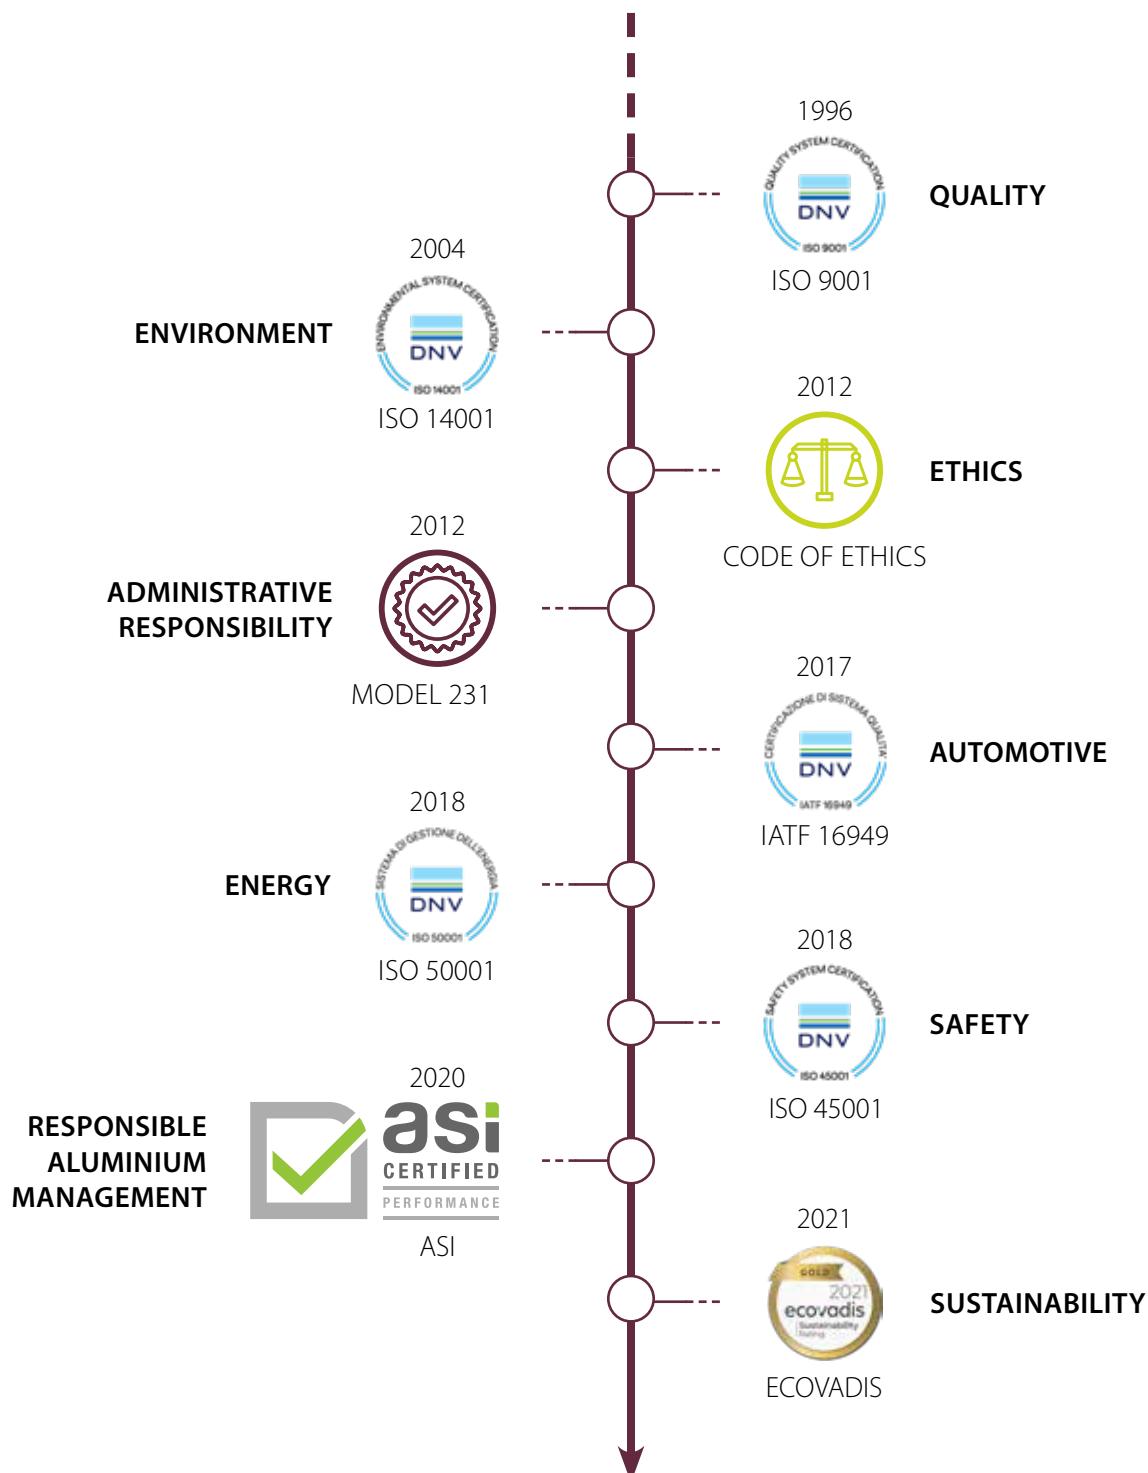

In 2013, an **oxygen pipeline** was built, with an investment of over 7 million €, which reduces CO₂ emissions and, in terms of safety, takes 2.500 trucks/year off the road.

CERTIFICATIONS

The certifications of its management and organisation systems and the certificates of responsibility and ethics give Raffmetal undisputed added value.

They are **synonymous with quality, attention, safety, prevention and responsibility**.

They are also a selection and preference tool for customers and suppliers, as a demonstration of the company's commitment.

The background of the image is a scenic aerial photograph of a mountainous region. In the foreground, there's a mix of green fields and some industrial or residential buildings. A winding road or railway track cuts through the landscape. The middle ground shows a valley with more greenery and possibly a small town. In the background, several majestic mountains rise against a clear blue sky.

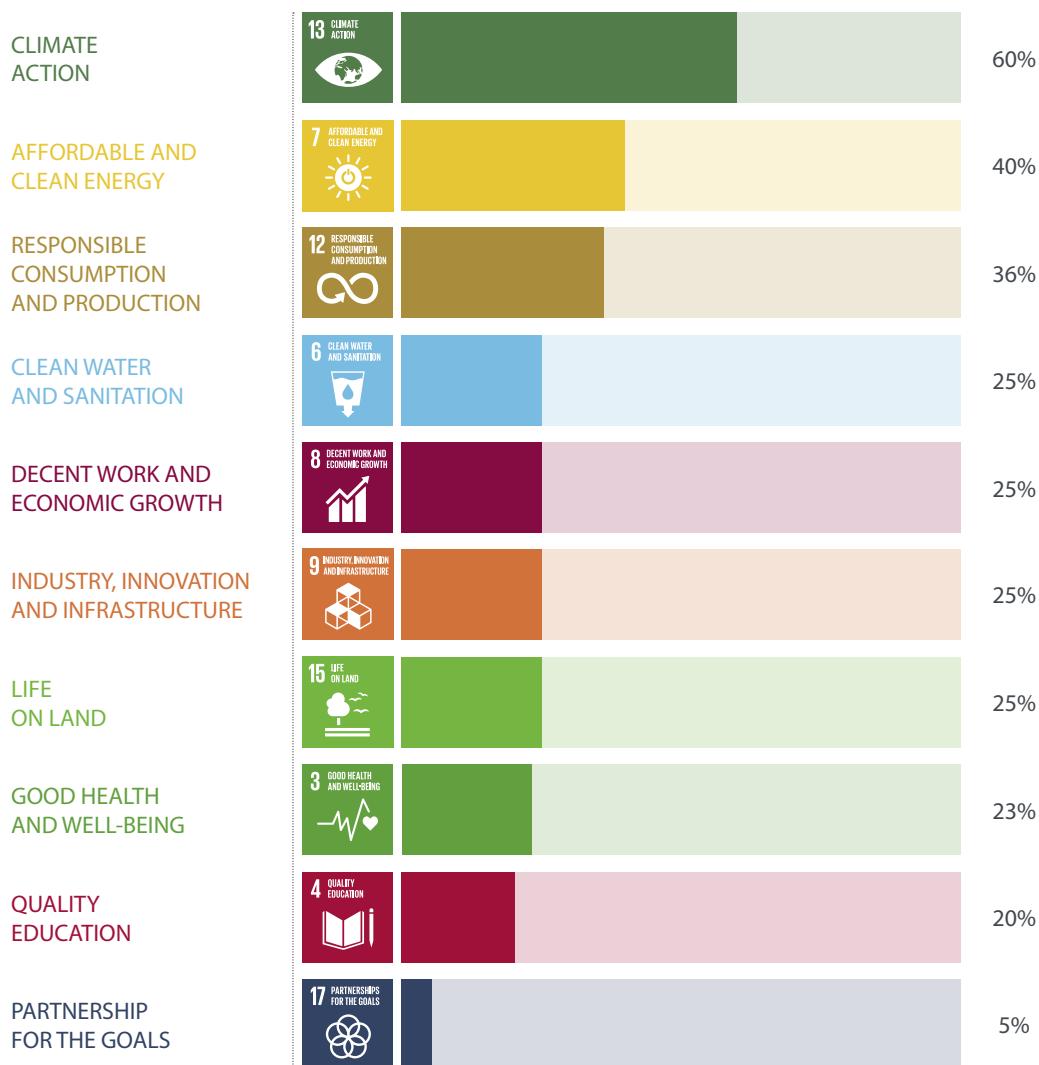

Sustainability for Raffmetal

THE SUSTAINABLE DEVELOPMENT GOALS IN RAFFMETAL'S SUSTAINABILITY POLICY

In September 2015, the United Nations endorsed the 2030 Agenda consisting of 17 Sustainable Development Goals (SDGs) and 169 sub-goals or targets as a strategy "to achieve a better and more sustainable future for all".

Raffmetal, after having mapped in previous sustainability reports the adherence of the company's missions and projects to the objectives of sustainable development, in 2020 has decided to quantify in an objective way through a software program its commitment to achieve the targets established and shared at universal level.

HOW MUCH RAFFMETAL'S ACTIVITY CONTRIBUTES TO REACHING THE SDGS

Data source: DNV Tools

The percentage specifies how well the company fulfils, with its policy, the total of the targets for each goal.

RAFFMETAL'S APPROACH TO SUSTAINABILITY

CIRCULARITY

We are convinced that the circular economy is one of the best responses to the many environmental and social problems we are experiencing.

Being part of a virtuous and circular system, where our role is to produce aluminium by recovering materials that have reached the end of their life cycles by giving them a new value, is a tangible demonstration of our active role in opposing a system based on linear economy.

ECO-EFFICIENCY

Efficiency and effectiveness have always been principles dear to us: also from a sustainability point of view we pay great attention to making the right choices in order to adopt procedures that maximise the economic benefit and minimise the social and environmental impact.

EVOLUTION

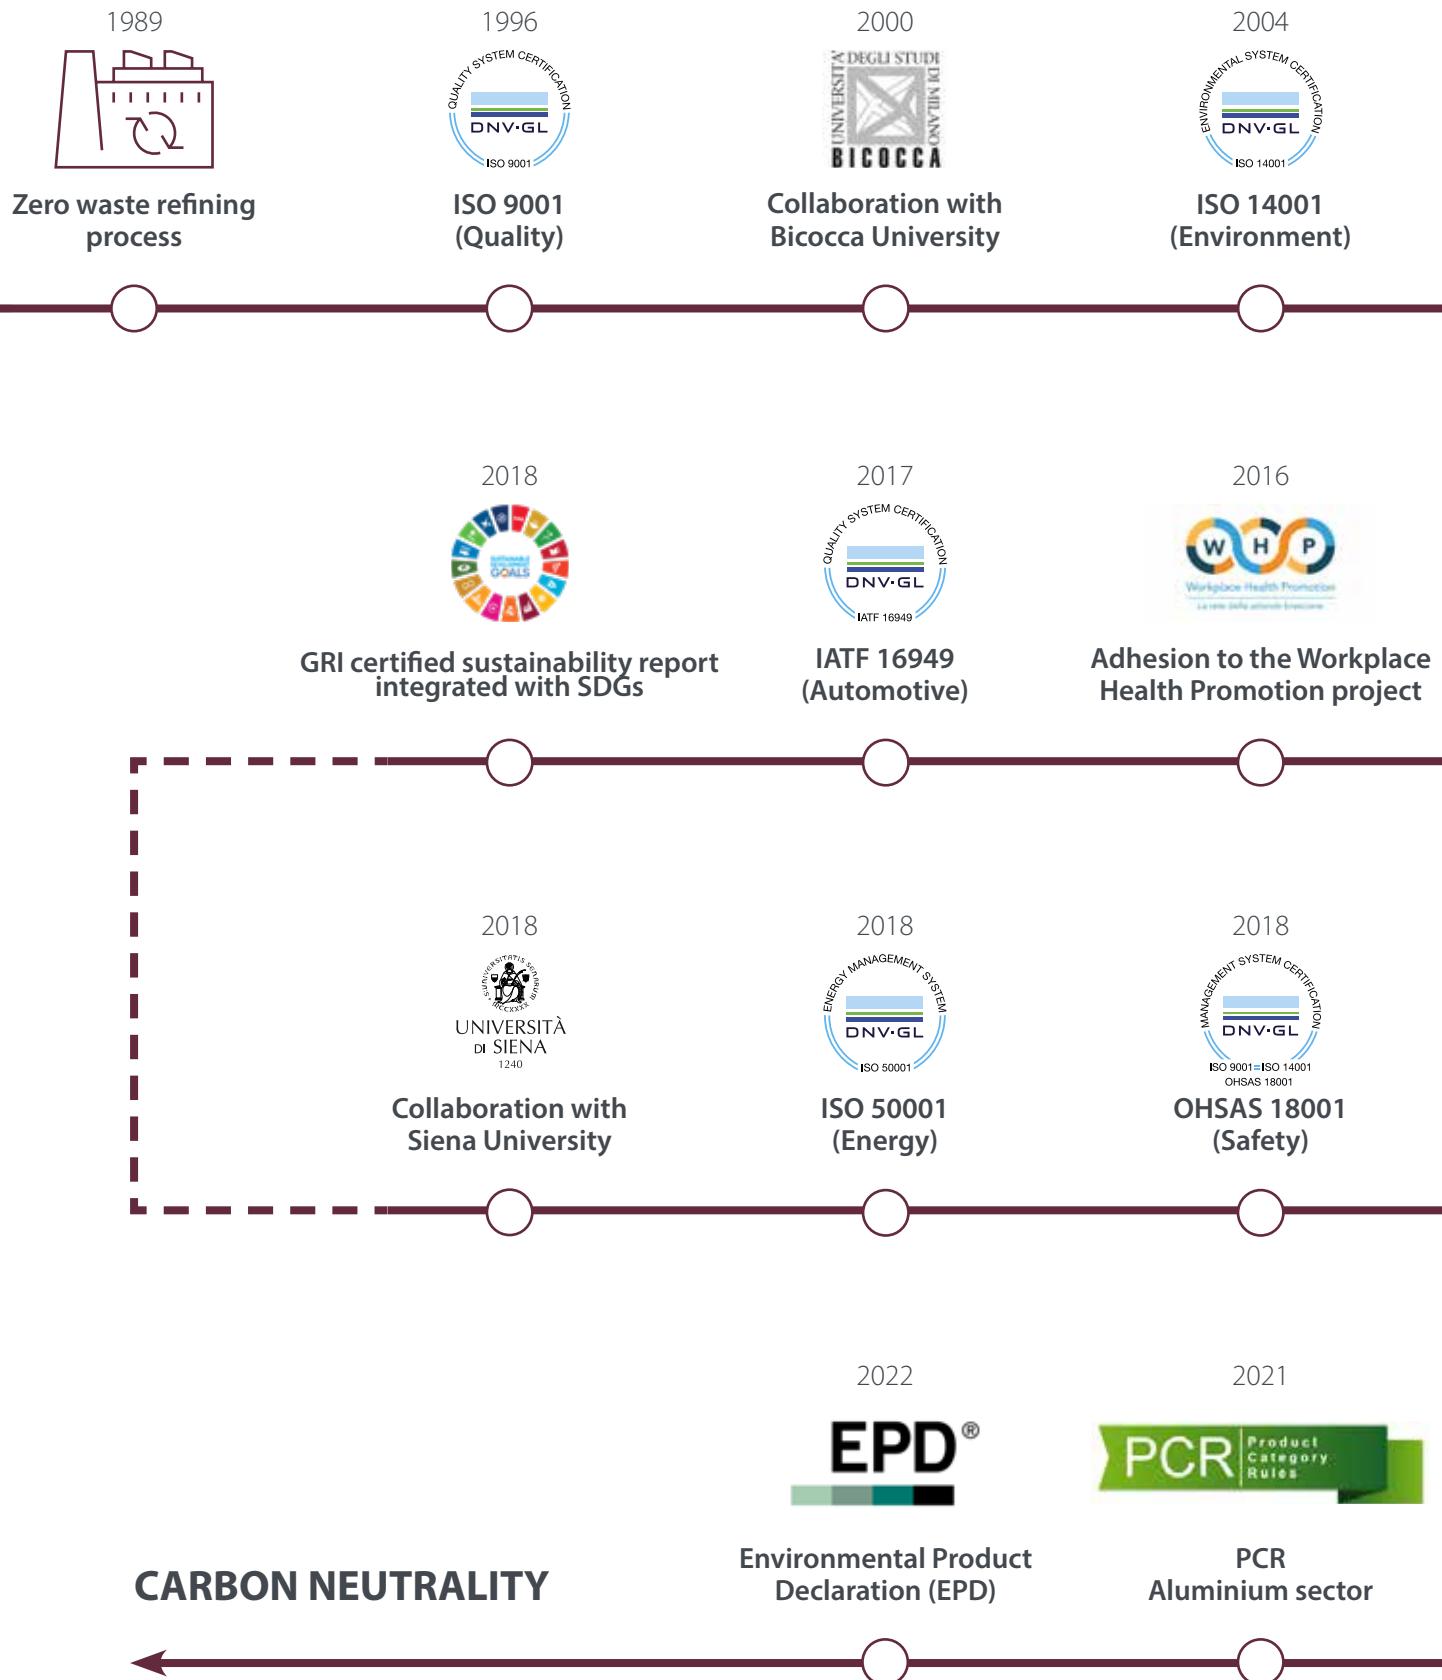

While a few years ago some areas of Raffmetal's sustainability were understood at project level, today we can see that "sustainable" practices, attitudes and ways of thinking and working have become part of the company processes.

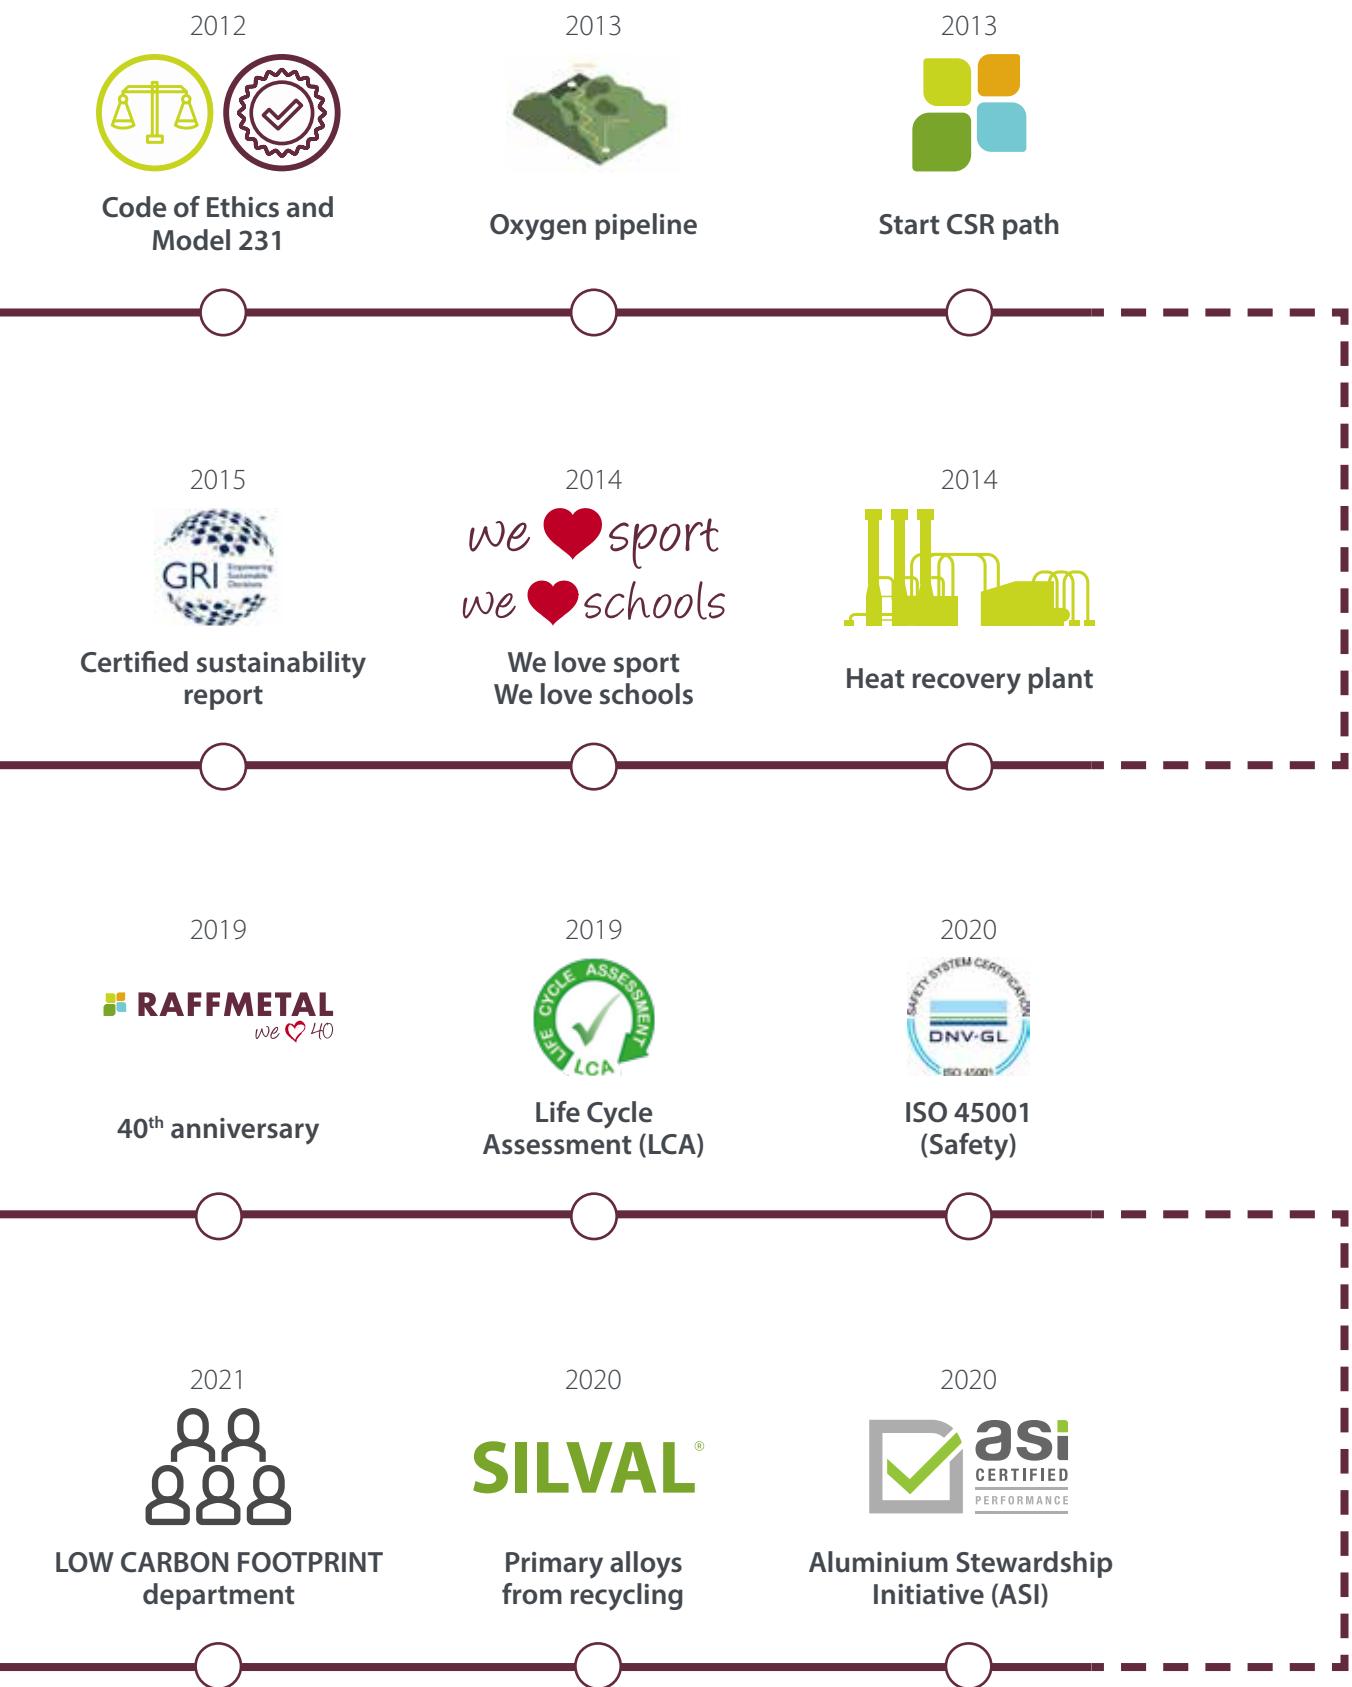

SUSTAINABLE DEVELOPMENT

The idea of sustainable development is a dynamic concept for us and is closely linked to innovation. We are always on the move and each material theme is approached on the basis of the three keys of interpretation mentioned above, that guide us in our way of thinking and acting.

THE SUSTAINABILITY PATH OF RAFFMETAL

03. ENERGY

Over the years, Raffmetal has made constant investments in production systems and in efficiency works able to lead to an almost total replacement of the steam produced by methane with steam produced through the recovery of heat from thermal residues.

Following the European directives for climate neutrality by 2050, Raffmetal has put all its efforts and resources into Research and Development aimed at the energy transition of its production processes.

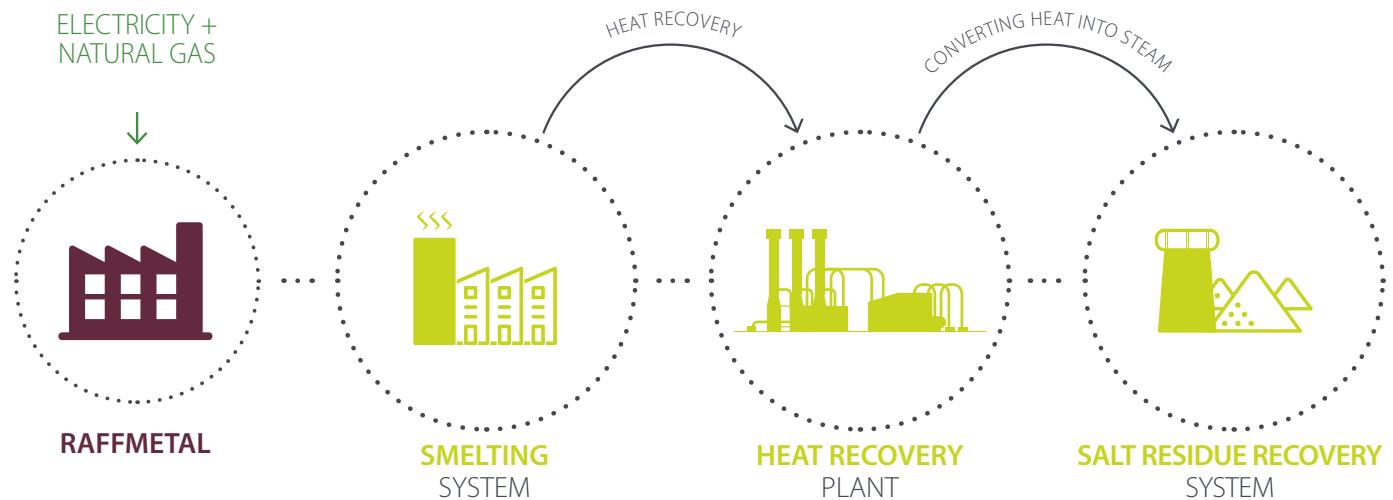

The strategy, which will be constantly implemented over the next few years, includes actions in the field of production and an increase in the purchase of renewable energy, as well as experiments in system upgrading for the use of new energy sources.

Heat Recovery Plant (IRC)

HEAT RECOVERY PLANT

From 2014, Raffmetal's Management has taken the brave and innovative decision to invest over 35 million € in a Heat Recovery Plant which involves the recovery of the heat contained in the exhaust gases from the afterburner of the rotary furnaces, from the by-product recovery system and from the drying system. The recovered heat is used to power the salt residue recovery system, thus eliminating the consumption of natural gas necessary for this process.

**Thanks to the heat recovery system, every year
we save around 30% of the total natural gas need**

=

Consumption/year of 800 households *

*Per capita emission in Italy: 7,20 tons CO₂ / inhab*year

04. ENVIRONMENT

Raffmetal's commitment and dedication to contribute to the fight against climate change emerge from real actions that have accompanied the company's evolution since its inception. Management procedures, dedicated staff, continuous monitoring and innovative technologies applied throughout the production process are proof of this.

Today's world is highly interconnected and requires everyone to take responsibility for each other on a global level, which is why **Raffmetal attaches the utmost importance to environmental protection.**

AIR PROTECTION

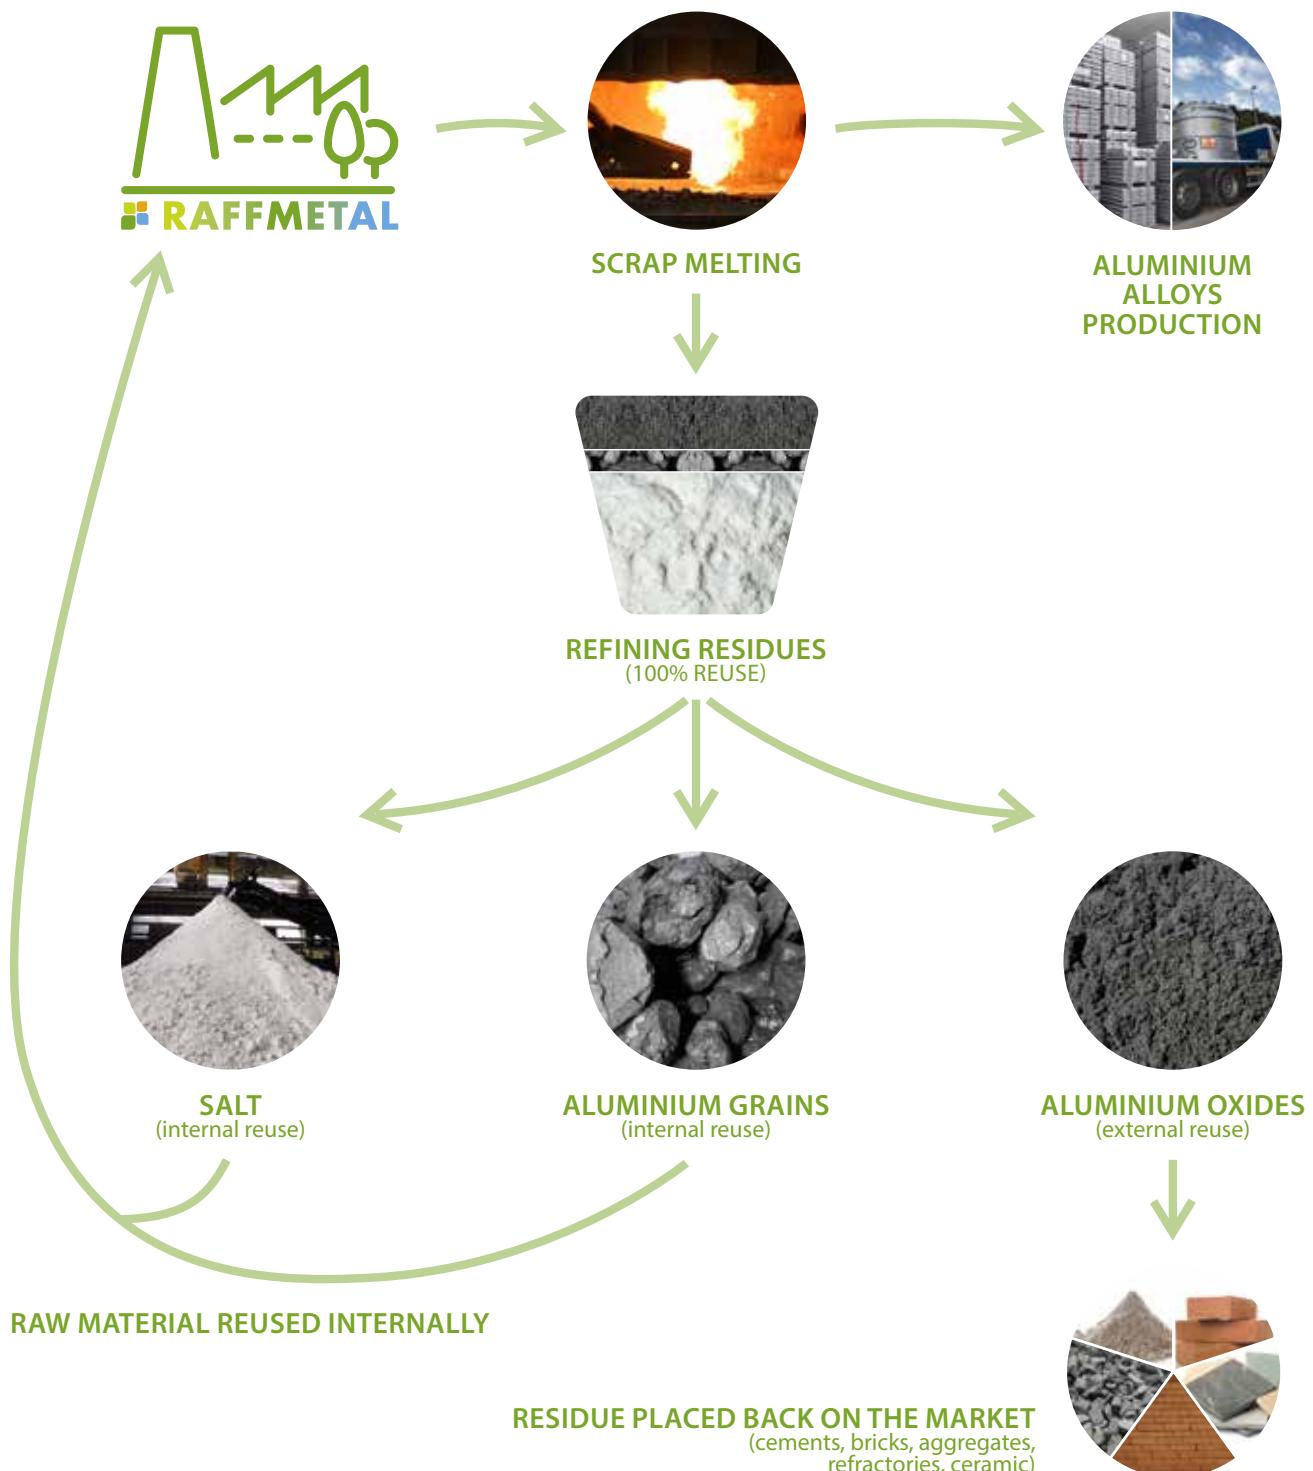

Raffmetal's systems comply with the Best Available Technology for the non-ferrous metals sector and are operated by experienced and qualified personnel; the application of an **environmental management system compliant with international ISO 14001** certification has over the years allowed the achievement **of emission values well below the legal limits.**

ZERO WASTE REFINING PROCESS

The production salt residue recovery system represents the first concrete action adopted by Raffmetal to achieve sustainability, efficiency and zero waste. The system was installed in 1989 and it allows the recovery and exploitation of the chemical components present in the residues of the smelting process: salt and aluminium granules are reintroduced in the Raffmetal cycle, while aluminium oxides are put back on the market.

RAFFMETAL ZERO WASTE REFINING PROCESS

WATER PROTECTION

The use of water in our production processes is of particular importance, especially during the casting and cooling phase of the metal. Significant quantities are also used in the pre-treatment of scrap and the recovery of melting by-products.

In order to protect the water resource, it has been chosen to include systems and technologies that minimise its consumption.

The water resource, currently drawn from the "delle Melie" spring in the Municipality of Casto and from the A2A waterworks in Vestone, is recycled several times through the cooling process in an evaporative tower, **limiting the withdrawal to the reintegration of the dispersed quantity due to evaporation.**

Currently, the only discharges are those from rain water that flow, after treatment, into the sewer system or into a surface water body.

These discharges are constantly analysed according to a monitoring plan in compliance with the Technical Annexes of the Integrated Environmental Authorisations.

PROTECTION OF BIODIVERSITY

Over the years, Raffmetal has acquired 104 hectares of meadows and woodland adjacent to its own facilities, more than half of which is woodland alone. Assuming an average of **280 shrubs** per hectare and calculating an average absorption of the vegetative population - composed of maple and ash tree wood, chestnut wood, beechwood, oak and hornbeam groves - of **15 kg of CO₂/year**, **Raffmetal's territory alone allows a CO₂ absorption of about 250.000 kg of CO₂/year***.

ABSORPTION CAPACITIES OF RAFFMETAL'S WOOD AREA*

*Data source: SunHeartTools.com

**Excluding those for industrial use

05. SOCIAL

Any production business has an impact on the social fabric of the territory where it is located, going well beyond the economic and employment effects, becoming a driving force for the diffusion of culture and values for the population, especially towards the new generations.

Therefore, Raffmetal supports **territorial development initiatives in order to create value in the local community**.

DONATIONS TO THE LOCAL COMMUNITY

OVER **€2.400.000**

DONATED TO THE REGION FROM 2014 TO 2020.

€1.000.000

IN SPORTS FACILITIES.

SPECIAL ALLOYS FOR OUR CUSTOMERS

Raffmetal's low-carbon footprint SILVAL alloys with high-recycling rate are designed to help our customers achieve their sustainability goals and meet the demands of increasingly environmentally conscious consumers.

For more information and custom alloys contact us: special.alloys@raffmetal.it
